

Unified Protection for High-Demand Decks

A complete portfolio of vehicular deck solutions
engineered, tested, and warranted as one.

From structural reinforcement to wear surfaces, **DriveDeck™** delivers total system performance.

Substrate Preparation & Reinforcement

The Foundation Layer

A high-performance vehicular deck system starts with a properly prepared substrate. DriveDeck substrate preparation and reinforcement products help stabilize concrete, manage movement, and address cracking before it affects the system above. Cement mixes, T-Biscuits, and concrete reinforcement fabrics work together to create a uniform, reliable foundation.

By integrating these components into the DriveDeck system, compatibility concerns are eliminated at the earliest stage of installation, supporting long-term performance and full system warranty coverage from the ground up.

Waterproofing & Structural Membranes

The Protective Core

The waterproofing membrane is the heart of the DriveDeck system, protecting the structure from moisture while accommodating movement and vehicular loads. DriveDeck acrylic, urea, aspartic, and urethane systems deliver flexibility, durability, and proven waterproofing performance under demanding conditions.

Multiple chemistries allow systems to be tailored to project needs without sacrificing compatibility. Every membrane is designed to work within the DriveDeck system, ensuring continuous protection and single-source accountability.

Wear Surfaces & Traffic Systems

Built to Take the Abuse

Wear surfaces must withstand traffic, abrasion, and environmental exposure while protecting the waterproofing layer below. DriveDeck traffic systems, including FlowStone®, are engineered specifically for vehicular use, providing durability, slip resistance, and consistent performance.

As part of a fully integrated system, DriveDeck wear surfaces are compatible with underlying membranes, helping the entire assembly perform as one under real-world conditions.

Primers, Adhesives & System Accessories

System Integrity Between the Layers

Primers and adhesives play a critical role in overall system performance. DriveDeck primers are designed to mitigate moisture concerns while promoting high bond strength between the substrate and subsequent layers. Epoxies and branded epoxy wetting compounds further reinforce adhesion and system continuity throughout the assembly.

By using system-specific primers and accessories, risks associated with third-party materials are eliminated. Every interface is engineered to work together, supporting long-term durability and comprehensive system coverage.

One Supplier. One Coordinated System.

DriveDeck delivers every layer of a vehicular deck system, from preparation and reinforcement to waterproofing and traffic surfaces, designed to work together as one. This integrated approach simplifies specification, eliminates compatibility concerns, and provides a single point of responsibility, backed by one comprehensive warranty.
